

Cignal Reporter Assay Kit

HSE Reporter Assay Kit

Cat. no. 336841 CCS-4023L

For study of pathway activity

The Cignal Heat Shock Element (HSE) Reporter Assay Kit is designed to monitor the activity of heat shock response through measuring transcriptional activity of heat shock transcription factors. The HSE reporter is a mixture of a heat shock-responsive luciferase construct and a constitutively expressing Renilla element (40:1). The heat shock-responsive luciferase construct encodes the firefly luciferase reporter gene under the control of a minimal (m)CMV promoter and tandem repeats of the HSE transcriptional response element. The number of response elements and the intervening sequence between these response elements has been experimentally optimized to maximize the signal to noise ratio. This construct monitors both increases and decreases in the transcriptional activity of heat shock transcription factors, and hence the activity of the heat shock response signaling pathway. The constitutively expressing Renilla construct encodes the Renilla luciferase reporter gene under the control of a CMV immediately early enhancer/promoter and acts as an internal control for normalizing transfection efficiencies and monitoring cell viability. Using a simple dual-luciferase assay, you can easily monitor the activity of heat shock response signaling pathways and determine the effect of various treatments, such as gene knockdown, over-expression, and chemical compounds on those pathways.

For further details, consult the *Cignal Reporter Assay Handbook*.

Shipping and storage

The Cignal Reporter Assay Kit is shipped on dry ice or blue ice. Store at -20°C. When stored under these conditions, this product can be used for 6 months from the date of receipt without reduction in performance.

Note: Open the package and store the products appropriately immediately on receipt.
