Description

The Rat Glucocorticoid Signaling RT² Profiler PCR Array profiles the expression of 84 key genes involved in signaling initiated by the glucocorticoid receptor. Secreted by the adrenal cortex, glucocorticoid hormones affect several biological processes, from inhibiting inflammation to maintaining normal blood glucose levels and more. Signaling occurs when the glucocorticoid receptor binds the cell-permeable hormones, causing nuclear translocation, interaction with other co-transcription factors (indicating a role of crosstalk with other pathways), and the activation or repression of target gene expression. The therapeutic use of glucocorticoids (such as the commonly used prednisone, dexamethasone, or hydrocortisone) helps treat various disorders including allergies, asthma, autoimmune diseases, dermatitis, leukemia, lymphomas, and rheumatoid arthritis. Their immunosuppressant activity also helps prevent acute transplant rejection and graft-versus-host disease. Resistance and side-effects (such as the susceptibility to infection and inhibition of tissue repair processes) limit the long-term use of these drugs, but has spurred research into the development of safer glucocorticoid analogs. Examining glucocorticoid transcriptional responses could help provide a better understanding of their effects on biological processes in any target tissue. This array includes the glucocorticoid receptors and key co-transcription factors, but mostly target genes identified from studies simultaneously using both chromatin immunoprecipitation (ChIP) and gene expression in the two key responsive tissues: adipose and lung. A set of controls present on each array enables data analysis using the $\Delta\Delta\text{CT}$ method of relative quantification, assessment of reverse transcription performance, genomic DNA contamination, and PCR performance. Using real-time PCR, research studies can easily and reliably analyze the expression of a focused panel of genes involved in glucocorticoid signaling with this array.

For further details, consult the *RT² Profiler PCR Array Handbook*.

Shipping and storage

RT² Profiler PCR Arrays in formats A, C, D, E, F, and G are shipped at ambient temperature, on dry ice, or blue ice packs depending on destination and accompanying products. RT² Profiler PCR Arrays in format H are shipped on dry ice or blue ice packs.

For long term storage, keep plates at -20°C .

Note: Ensure that you have the correct RT² Profiler PCR Array format for your real-time cycler (see table above).

Note: Open the package and store the products appropriately immediately on receipt.

Array layout (96-well)

For 384-well 4 x 96 PCR arrays, genes are present in a staggered format. Refer to the *RT² Profiler PCR Array Handbook* for layout.
