

QIAseq Targeted DNA Pro Panels

Human Brain Cancer Research

Cat. nos. 333651 PHS-004Z-12 and 333655 PHS-004Z-96

For ultrasensitive targeted next-generation sequencing (NGS) of DNA

The QIAseq Targeted DNA Pro Human Brain Cancer Research Panel permits the targeted next generation sequencing analysis of the whole coding region of 50 oncogenes and tumor suppressor genes relevant to brain cancer, covering 199,053 bases with 2,742 primers. The panel also targets actionable and interpretable cancer-related somatic variants relevant for tumor classification of anaplastic glial tumors, astrocytomas, ependymomas, glioblastomas, gliomas, medulloblastomas, meningiomas, oligodendrogliomas, and other brain cancers. Targeted actionable and interpretable genes and variants were collected from 1) clinical practice guidelines recommended by multiple organizations, including the American College of Medical Genetics (ACMG), the American Society Of Hematology (ASH), the Association for Molecular Pathology (AMP), the American Society of Clinical Oncology (ASCO), the College of American Pathologists (CAP), the European Society for Medical Oncology (ESMO), and the National Comprehensive Cancer Network (NCCN); 2) the NIH NCBI ClinVar and Online Mendelian Inheritance in Man (OMIM) resources that compile variants with known associations to cancers cited by peer-reviewed publications, 3) clinical trial documents from resources such as Cancer.gov, ClinicalTrials.gov, and the UMIN Clinical Trials Registry; 4) requests and suggestions from QIAGEN KOLs and SMEs; and 5) other peer-reviewed publications. As a result, this primer pool gives researchers a comprehensive insight into brain cancer genomics with the detection of SNP/indels in a focused panel of relevant genes using digital DNA sequencing.
